
Chapter 14 - Crate

JEFF LABONTE

1 Cargo - Compiling

Cargo is handling the compilation optimisation level, it is possible to change the optimisation level in the Cargo.toml file.

There is 2 different compilation mode; one for development and the other for release. Obviously, the one for development is the fastest, since we don't really care about the speed of the code we are running in test.

These are the default values :

```
[ profile . dev ]  
opt-level = 0
```

```
[ profile . release ]  
opt-level = 3
```
